EDUCATION

Polytechnic University of the Philippines | Sta. Mesa, Manila

2024 - 2028

B.S. in Computer Engineering

Relevant Courses: Data Analysis, Numerical Methods, Advanced Engineering Mathematics, Data Structures and Algorithms, Object Oriented Programming, Calculus 1 & 2, and Differential Equations

TECHNICAL SKILLS

Languages: Python, SQL, JavaScript, TypeScript

Data Analysis: pandas, numpy, scikit-learn, matplotlib, seaborn

Databases: MySQL, SQLAlchemy

Web Technologies: Flask, Streamlit, HTML, CSS, React.js, Next.js

Tools: Jupyter Notebook, Git / Github, VSCode

PROJECTS

LogistIQ | Full-stack Logistic Website

MAY 2025 - June 2025

- **Led a team of six:** conducted weekly agile meetings and managed the complete lifecycle of a full-stack application (Flask, MySQL, HTML/CSS/JS), establishing clear timelines for development stages and final deployment.
- **Curated and synthesized data:** Sourced primary datasets via Kaggle and engineered synthetic user datasets, establishing a robust testing environment and foundational database architecture.
- Defined project scope and technical milestones, successfully bridging database management with front-end execution to ensure all project goals were met on schedule.

Financial Fraud Detection System

June 2026

- Accomplished a fraud detection model achieving **94%** recall and **95%** accuracy by implementing Logistic Regression with **balanced class weights** on a **6.3M** transaction dataset.
- Engineered critical features such as balance discrepancies and transactional flow patterns, identifying that 100% of fraudulent activity was concentrated in specific transaction types, which significantly enhanced model precision.
- Developed an end-to-end pipeline for real-time risk assessment by deploying a Streamlit web interface integrated with automated Scikit-learn preprocessing.

Performance Predictor

May 2026

- Engineered an end-to-end Student Performance Prediction system attaining an **88.04%** R2 score (Flask, Next.js).
- Developed a modular pipeline for **automated** data ingestion, feature engineering, and hyperparameter tuning (GridSearchCV) across 7+ models including XGBoost and CatBoost.

Hexnode | DSA visualizer

December 2025 - January 2026

- Developed interactive Binary Tree and Fibonacci visualizers using React and @xyflow/react, implementing real-time traversal algorithms (Preorder, Inorder, Postorder) and Dynamic Programming logic with synchronized pseudocode highlighting.
- Engineered a recursive state-generation engine to map algorithmic execution steps to UI components, enabling users to trace complex computations through adjustable-speed playback and real-time state tracking.
